

Quiz #14

1. The following code was written by somebody who does not know how to use MATLAB efficiently. Vectorize this code as a single statement that will accomplish exactly the same thing for a matrix variable *mat*. Use the `randi` function to generate *mat*.

```
[r c] = size(mat);  
for i = 1:r  
    for j = 1:c  
        mat(i,j) = mat(i,j) * 2;  
    end  
end
```

2. Create a function that will calculate the area and perimeter of a rectangle given the base and height measurements. Use a formatted print statement to display the results. See below for example output.
A rectangle with base = 10.00 and height = 5.00 will have an area = 50.00 and a perimeter = 30.00.
